TERMA CONNECT
CONNECT LITE

Maximize the uptime of your surveillance & mission systems

Imagine being able to continuously monitor the operational status of all your Terma radar systems in one view, without risking to accidentally controlling them; Connect makes this possible.

Connect is Terma's digital service platform bringing the insights you need to rapidly bring degraded or failing systems back in full operation.

Connect Portal
The Connect Portal is the operator entry point to your radar operational situation. From here you can view the health status of all connected radar systems on your pc or display it on a dedicated screen in your maintenance or operations room. Detailed information of current errors & warnings is also available, making it easy to take immediate corrective action.
The Connect Portal also includes user role management as well as the possibility to add new radar systems.

Connect Server
The Connect Server is the local Connect backbone. Built by Terma and provided as a physical server it can be placed in a server room, with no need to be physically near the radar systems themselves. The server collects and stores health data from all connected systems to display on the Connect Portal. The server is set up within your local network (LAN) and only accessible by authenticated users. Communication with the Connect Portal is one-way thus the risk of accidentally reconfiguring or shutting down the radars through the Connect Portal is eliminated.

Connect Lite includes the following:
- A **Health Dashboard** with an intuitive user interface to quickly get an overview on the operational status of your radar systems
- A Current and History **Notifications** page with an overview of errors and warnings that could potentially lead to system degradation; and a history of the latest notifications and when they were cleared.
- **User Role Management**, enabling multiple users to gain access to the Connect Portal if they have access to the local network.

- Two built-in user roles (Viewer or Administrator) to control user access levels.
- NTP Synchronization.

Connect is available for most products in the of SCANTER radar product portfolio. Reach us out for more information.
